

# RISA Webinar

## In-Depth Look at Wood Wall Design in RISA

Presenter: Deborah Brisbin, P.E.

Version 4.1

Version 8.1

LATEST VERSION

Walls geometry is based on the Design Rules Spreadsheet (Studs, etc.)

Wood Wall Panel Parameters						
	Label	Top Plate	Sill Plate	Studs	Min Stud S...	Max Stud ...
1	Typical	2-2X6	2X6	2X6	16	16

Design criteria can be set in the Design Rules

Additional Wood Wall Panel Parameters									
	Label	Schedule	Min. Panel...	Max. Panel...	Double Si...	Max. Nail ...	Min. Nail S...	HD Chords	HD Chord M...
1	Typical	IBC06 Panel Database	.375	.4688	Optimum	6-in.	3-in.	2-2X6	Same as Wall

Or you can narrow down the criteria in the Wood Schedules

## Wood Wall Parameters

## Using this Spreadsheet

- Select the Code

Then select the “Group” for design OR Select a Single Panel

- Based on the Excel Spreadsheets outside of the RISA programs

C:\RISA\RISA\_Wood\_Schedules\ShearPanels

Wood Wall Panel Schedule

Select Code: IBC\_06

Available Panel Groups: IBC06 Panel Database, 0.3125 Panel Group, 0.375 Panel Group, 0.4375 Panel Group, 0.469 (8d) Panel Group, 0.469 (10d) Panel Group

Current Selection Type: Select Entire Panel Group (checked), GROUP

## Required Fields

### Label

**Deflection at Peak Load** used to calculate the deflection per APA/NDS formula.

$$\delta_{sw} = \frac{8vh^3}{EAb} + \frac{vh}{1000G_a} + \frac{h\Delta_a}{b}$$

$\Delta_a$  = Total vertical elongation of wall anchorage system (including fastener slip, device elongation, rod elongation, etc.) at the induced unit shear in the shear wall, in

Since this is the PEAK Load, to find the actual deflection it is scaled per the actual tension force; by multiplying this value by the holdown ratio given in the output.

- Automatically meshed

Mesh Size controlled by  
Global Parameters

# FEA Analysis

## Wall Panel Loads

### Distributed Loads

- Global Axis (X,Y,Z)
- Local Axis (x,y,z)

### Joint Loads

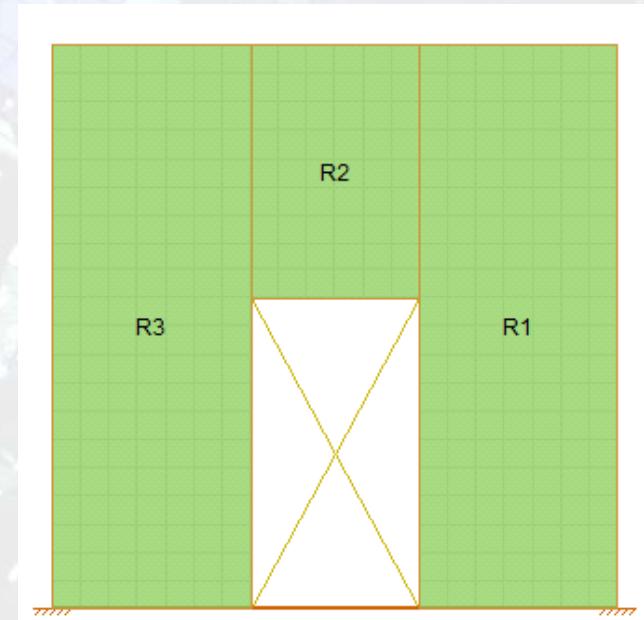

- Joint Loads can be anywhere on the wall
- Need to create a Joint first

### Surface Loads

- Not advisable for Wood Walls with Flexible Diaphragms  
Very little Out of Plane Stiffness

Segmented Design based on “Regions” defined within a wall

- A Region must be Rectangular
- Regions can be defined by the user
  - Auto-Defined 
  - OR Not defined and Auto-Defined at run-time
- Only the Full-height Regions are designed
- Hold Downs are automatically placed at each side of the region

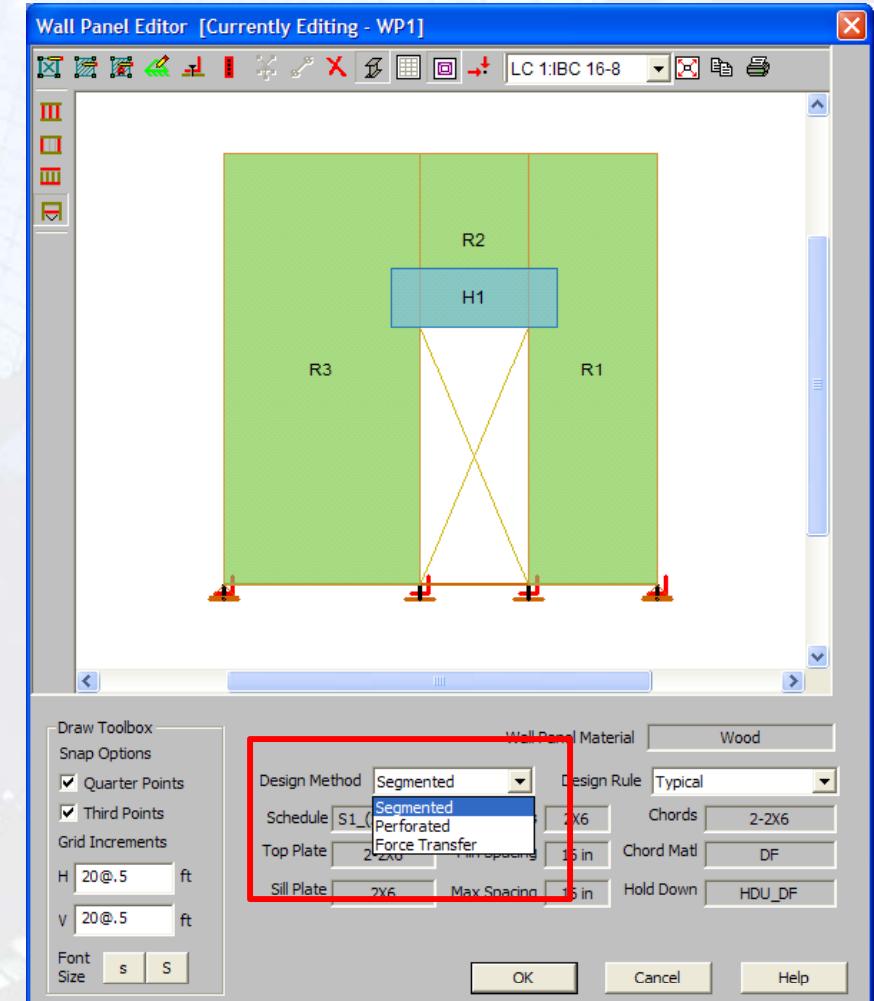

## Segmented Design

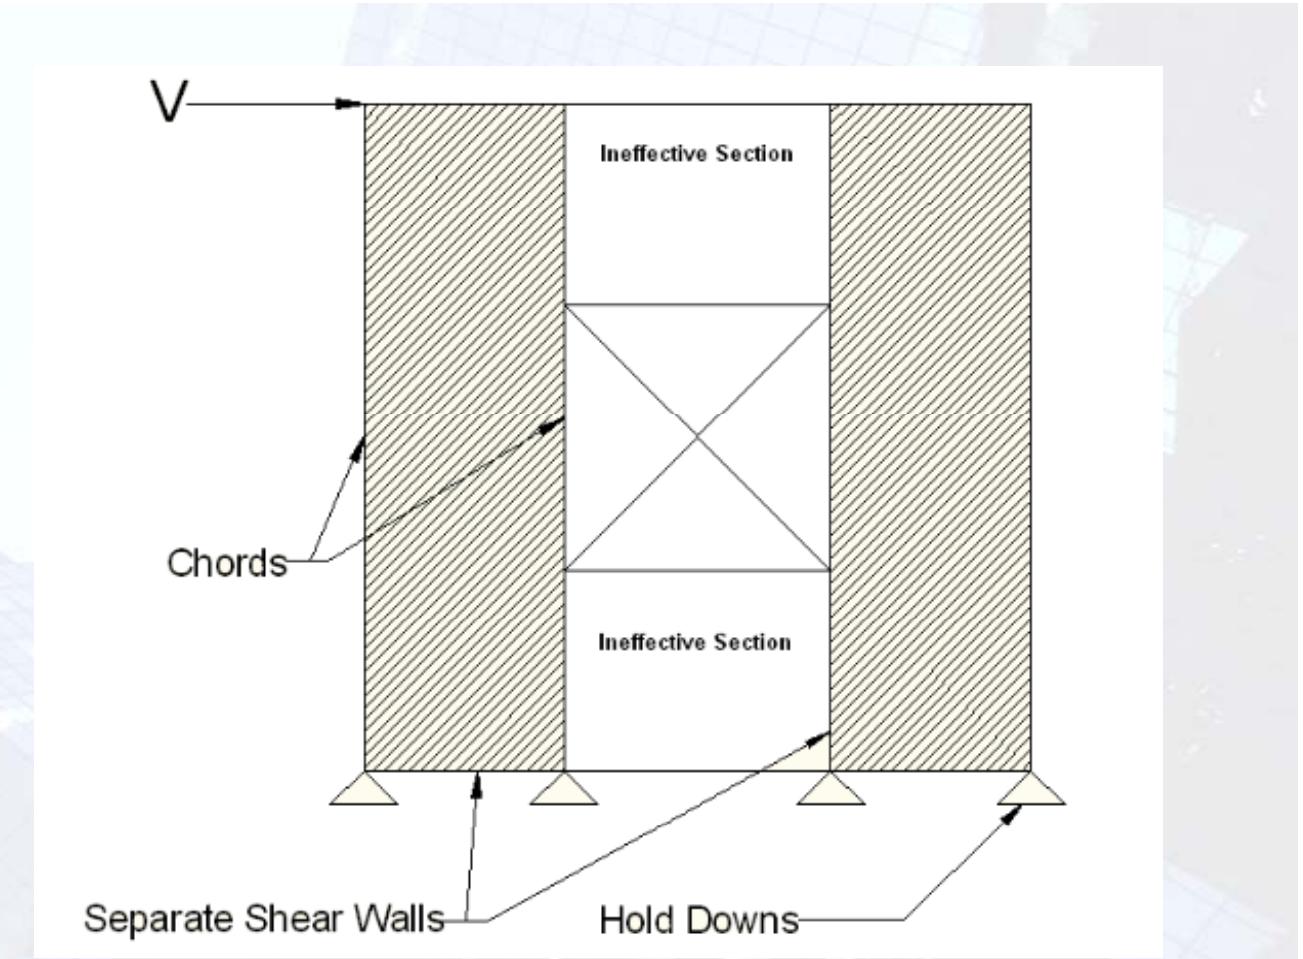

Select Design Method in Wall Panel Editor:

- Segmented
- Perforated
- FTAO

Or in the Wall Panel Spreadsheet

Wall Panel Data											
	Label	A Joint	B Joint	C Joint	D Joint	Material Type	Material Set	Thickness...	Design Rule	Design Method

2	WP2	N6	N7	N8	N9	Wood	DF Larch	5.5	Typical	Segmented	1

#### SSAF (Shear Stiffness Adjustment Factor)

This column allows the user to manually adjust the shear stiffness of a particular wall panel.

With this adjustment factor the user can match up the deflections from their hand calculations with the FEM joint deflections at the top nodes in the wall.

the lateral tabular values

Stud Spacing- Per Design Rules

### Design Summary

- Shear capacity from Wall Panel database  
(based on IBC 06 Table 2306.4.1)
- Chords Forces

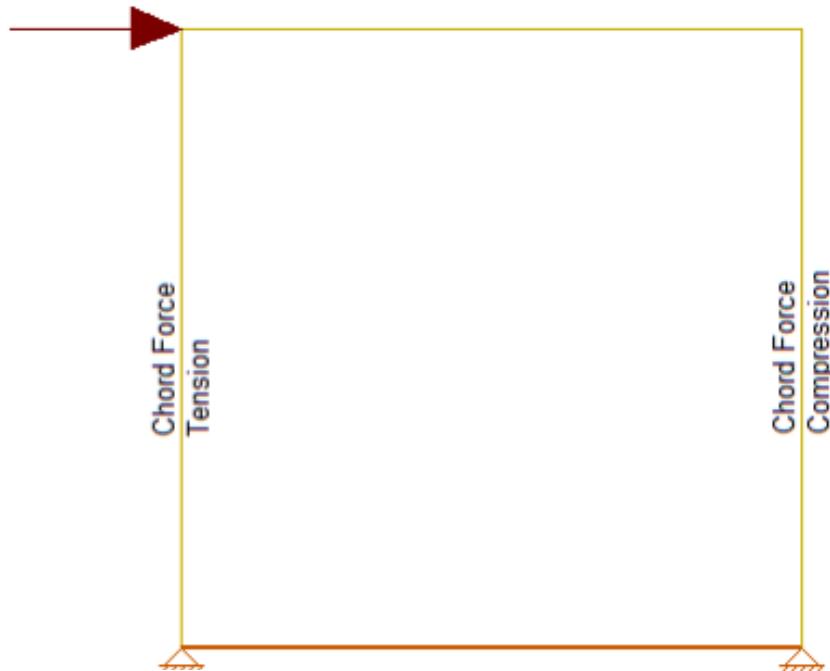

# Region Detail Report

## Chord Forces

- Calculated differently Tension vs. Compression
- Tension: NDS 2005 4.3.6.4.2 includes Dead Load stabilizing moment
- Compression: Include only the tributary area of one stud spacing

Segmented Design: Chord forces based on only one Region

FTAO & Perforated: Chord Forces based on the entire wall

$$\text{Chord Force} = \frac{M}{L} - \frac{P}{2}$$

$$\text{Chord Force} = \frac{M}{L} + \frac{P}{\# \text{ Studs}}$$

M = Max Moment in the wall

L = Length of the wall

P = Axial Force in the wall

## Chord Design

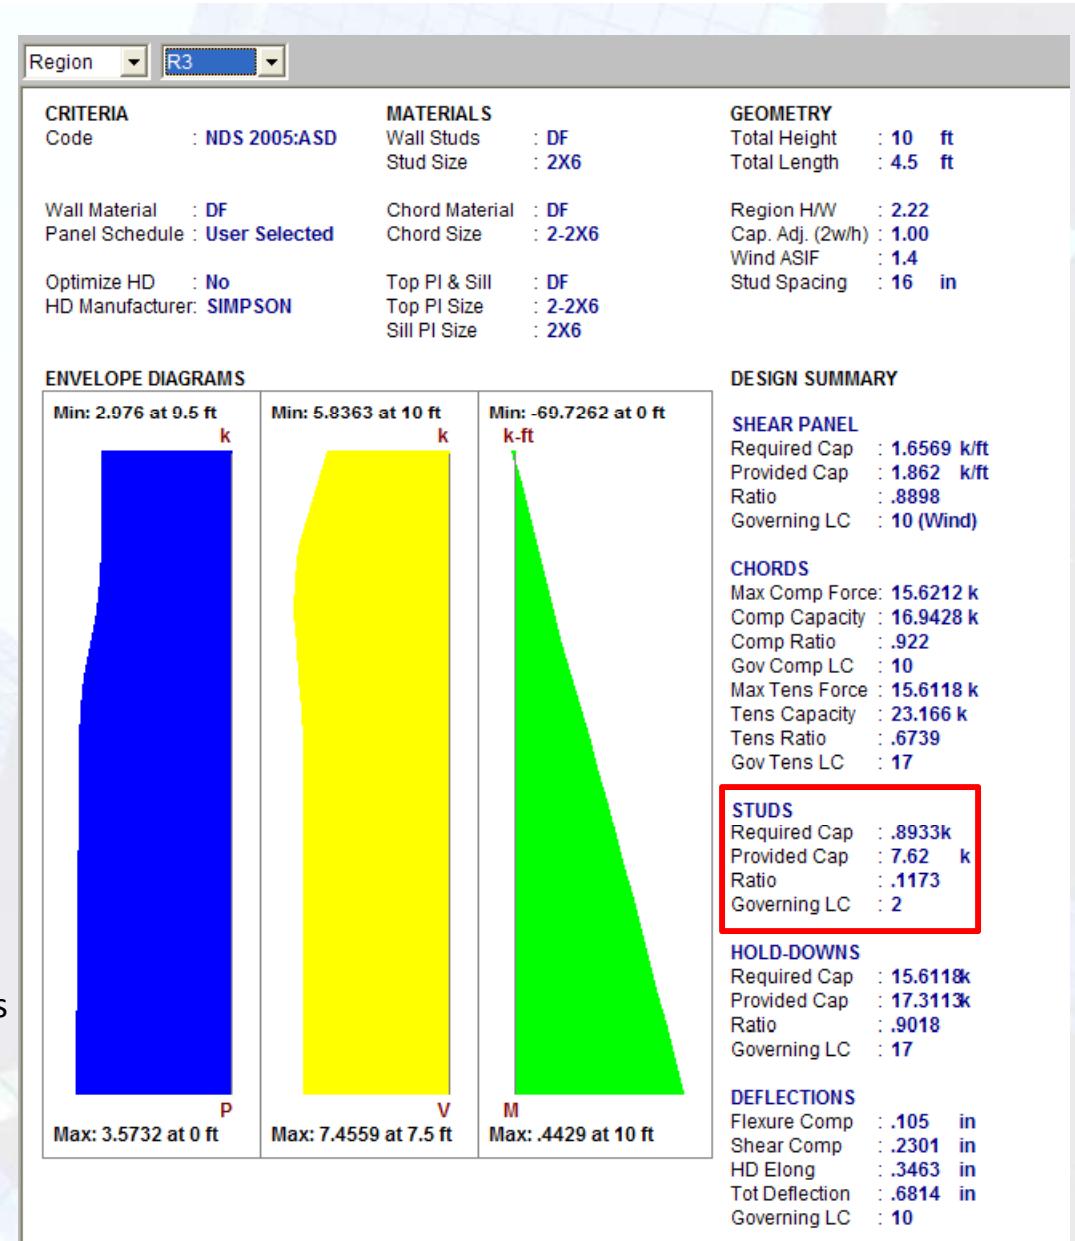

## Stud Design

- Stud design is based on Enveloping the maximum section forces from each region over the entire wall.
- Stud Spacing based on Required Capacity (unless spacing explicit in Design Rules)
- Code Check: Required Cap / Provided Cap
- Optimizing spacing starts at max and work its way down at 2" increments

**NOTE: All the load combos considered**

Run a batch solution with only Gravity only loads

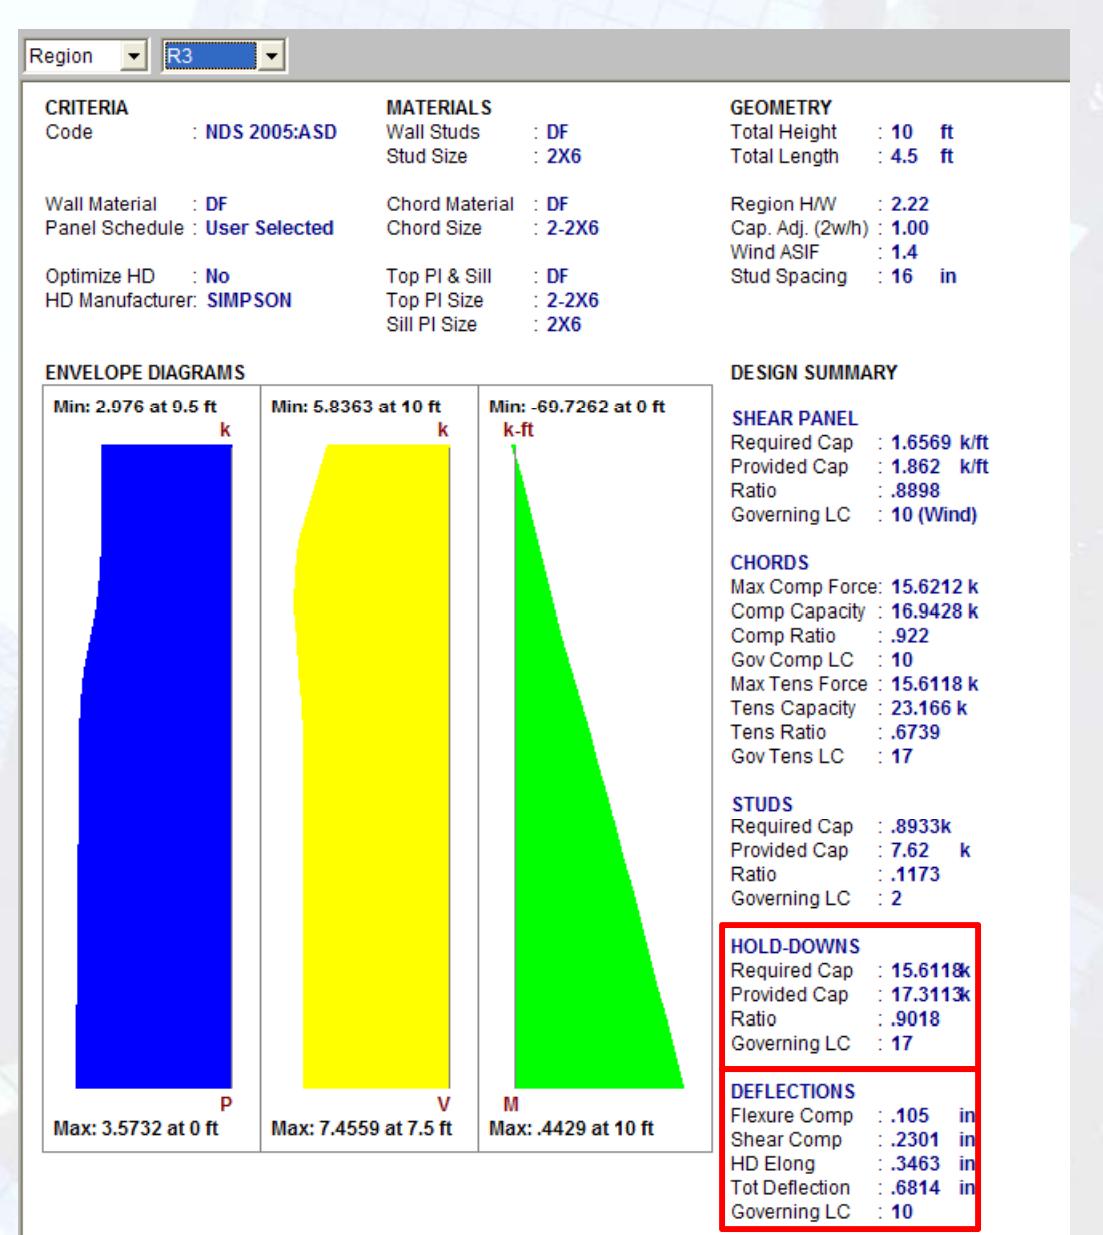

## Region Detail Report

## Hold Down Forces

- Tension only forces
- Provided Cap is the **Allowable Tension** column of the hold-down database.
- The hold-down LC Governing is the largest tension force.

**NOTE:** The HD Deflection is reported for the maximum shear LC, which may not result in the largest hold-down component, but typically results in the highest total deflection.

## Region Detail Report

DESIGN DETAILS	
SELECTED SHEAR PANEL :	S1_(2)15/32_10d@3
Panel Grade :	St-I
Panel Thick :	0.469 in
Nail Size :	10d
Reqd Pen :	1.250 in
Reqd. Spacing :	3 in
Num Sides :	Two
Over Cyp. Brd. :	No
Shear Capacity :	1.330 k/ft
Adjusted Cap :	1.862 k/ft
NOTE: NDS 2005 defines a 10d nail as being	3.0" x 0.1480" common or 3.0" x 0.122" galvanized box

SELECTED HOLD-DOWN :	
Raised :	No
AB Diameter :	1.000 in
Fastener Size :	SDS25212
Num Fasteners :	36
Reqd Chord Thk:	5.50 in
Reqd Chord Mat.:	Douglas Fir
Base Capacity :	10.820 k
CD factor :	1.6

## Selected Shear Panel

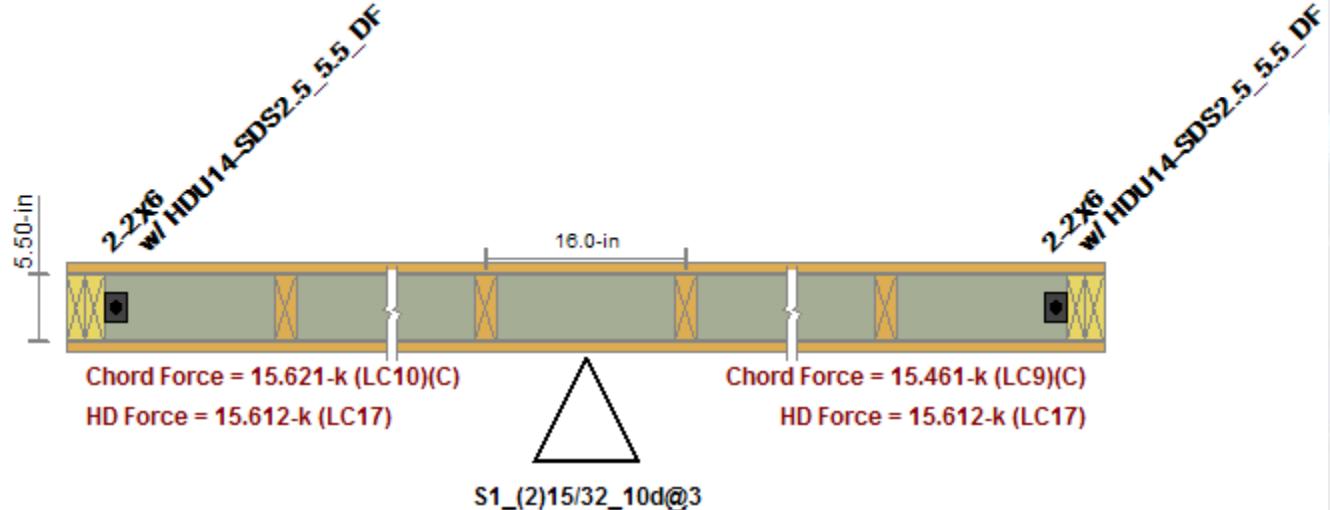

- Echo all information from Shear Panel Database
- Adjusted Capacity:
  - Seismic force controls: 2bs/h from IBC06 2305.3.8.2.2.3
  - Wind force controls: 1.4 Increase

## Selected Hold-Down

- Echo all information from Hold-Down Database
- The "Base Capacity" is the capacity from the manufacturer divided by the assumed Cd value from the database.  
The actual capacity of the hold-down is the Base Capacity\*CD factor.

# Region Detail Report

#### CROSS SECTION DETAILING

#### Cross Section Detailing

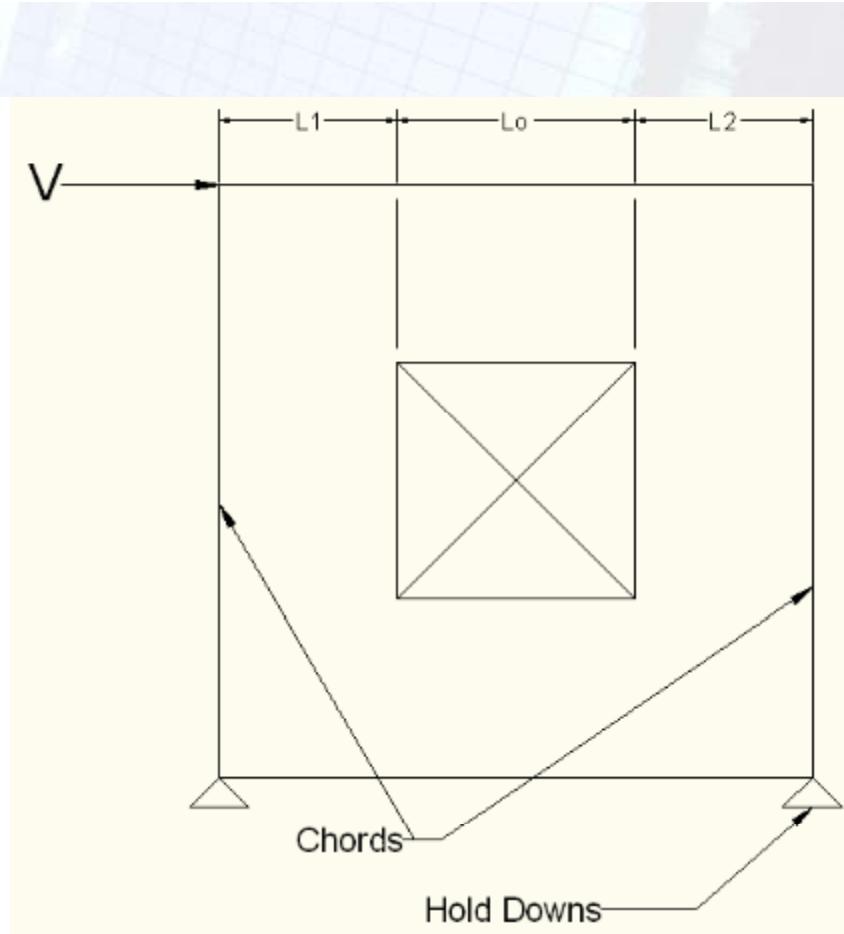

- Wall thickness, and stud spacing
- Sheathing panel designation.
- Chord sizes/forces with T= Tension, or C=Compression forces
- Hold down designations/forces

Note: If either chord is only experiencing a compression ONLY force, the hold down will not be drawn.

## Region Detail Report

## Perforated Design

- Use only the portions of wall that have full height sheathing
- Treat the wall instead as a significantly shorter wall.
- Amplifies the chord and hold down design forces significantly while at the same time increasing the design unit shear
- There are a number of Code constraints- which are enforced in RISA (NDS05 4.3.5.3)
- Hold Downs only at the ends of the walls

**CRITERIA**

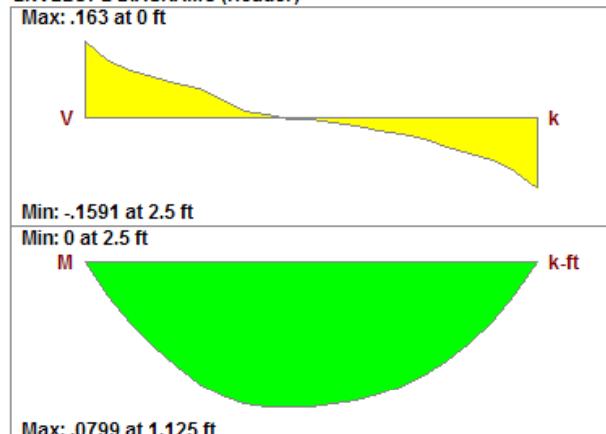

Code : NDS 2005: ASD  
Wall Type : Perforated

**GEOMETRY**

## Perforated Design- Header Design

- All Load combinations enveloped
- Header suggestion: Run Gravity Loads for design

- Code check based on Shear and Moment only  
Not Axial Loads

# Perforated Design

Perforated wall design.r3d

The length of the wall is calculated:

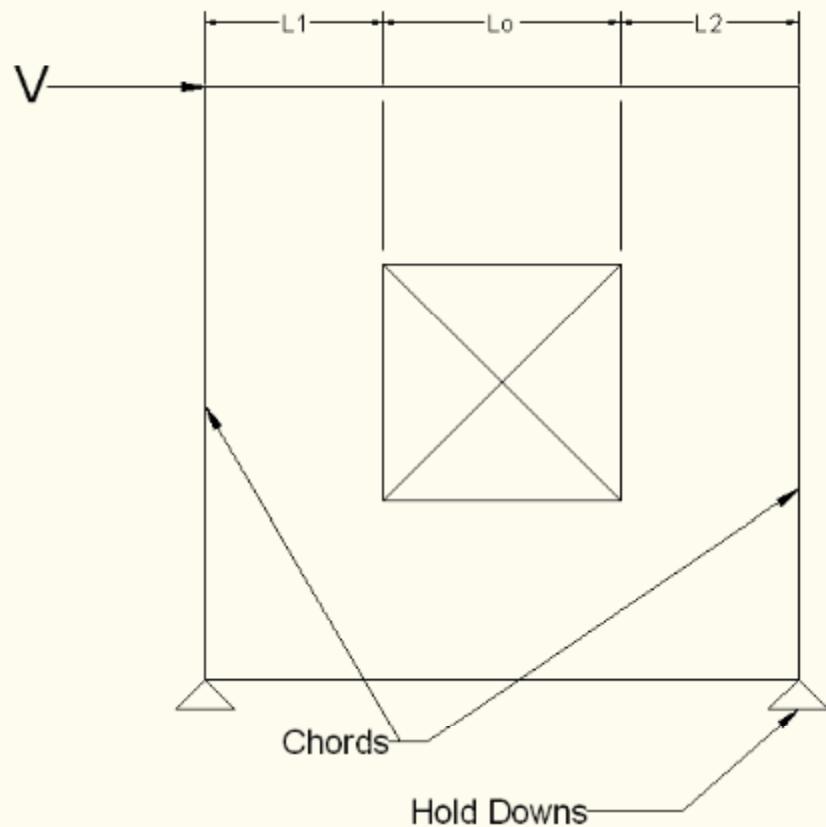

$$\Sigma L_i := L_1 + L_2$$

Max induced unit shear force (NDS05 4.3-6):

$$v_{max} := \frac{V}{C_o \cdot \Sigma L_i}$$

Tension and Compression Chord forces (NDS05 4.3-5)

$$T := \frac{V \cdot h}{C_o \cdot \Sigma L_i}$$

$C_o$  = Shear Capacity Adjustment Factor (NDS05 Table 4.3.3.4 )

or

Calc using equ. available in NDS08

$$C_o = \left( \frac{r}{3 - (2 * r)} \right) * \frac{L_{tot}}{\Sigma L_i}$$

$$r = \frac{1}{1 + \left( \frac{A_o}{h * \Sigma L_i} \right)}$$

## Perforated Design

$$Co = \left( \frac{r}{3 - (2 * r)} \right) * \frac{L_{tot}}{\Sigma L_i}$$

$$r = \frac{1}{1 + \left( \frac{Ao}{h * \Sigma L_i} \right)}$$

Ao defined by NDS05 Table 4.3.3.4

“maximum opening height shall be taken as the Maximum opening clear height in a perforated shear wall.”

$$Ao = 2.5' * 5' = 15 \text{ ft}^2$$

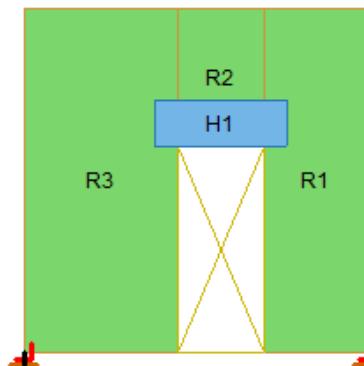

$$r = \frac{1}{1 + (15/10*7.5)} = .83$$

$$Co = \frac{.83}{3 - (2 \times 0.83)} * \frac{10'}{7.5'} = .83$$

**GENERAL**

# Perforated Design

### Chord Forces

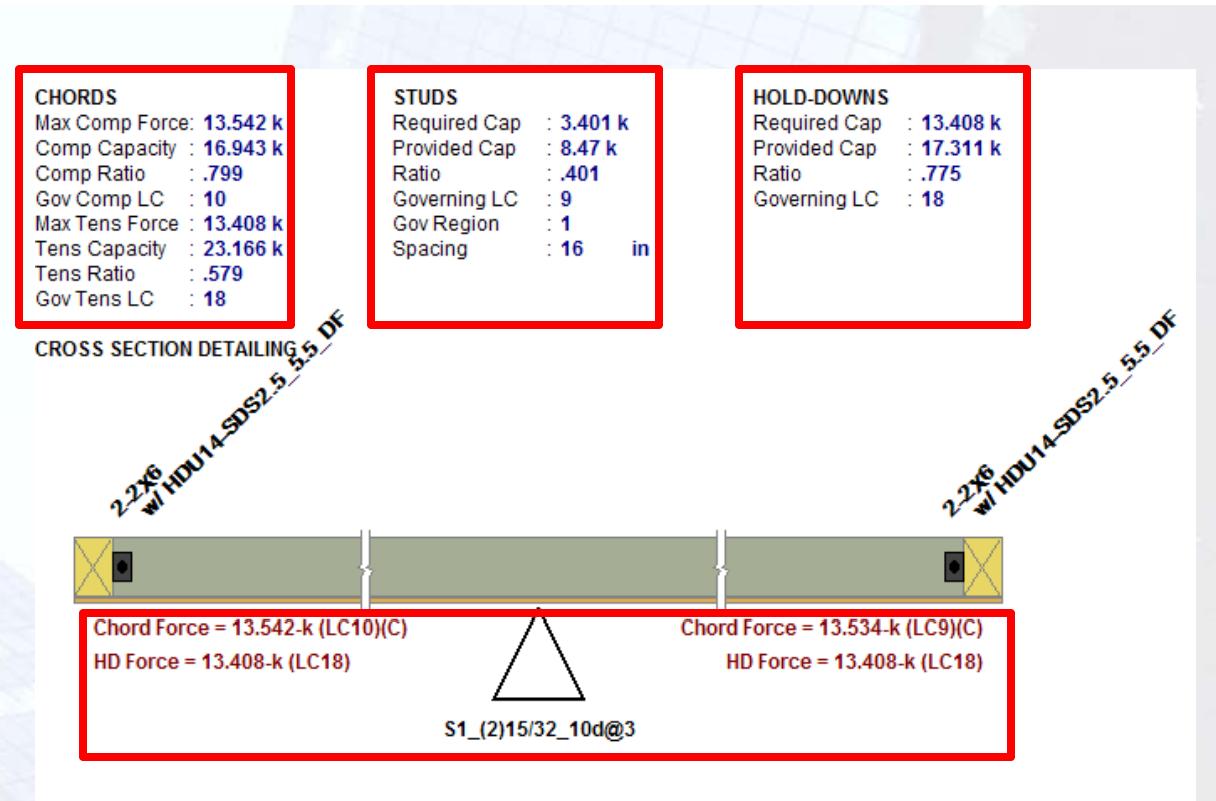

- Each side of the wall is governed by different Load Combinations (T or C)

### Stud Design

- Design Spacing

### Hold Downs

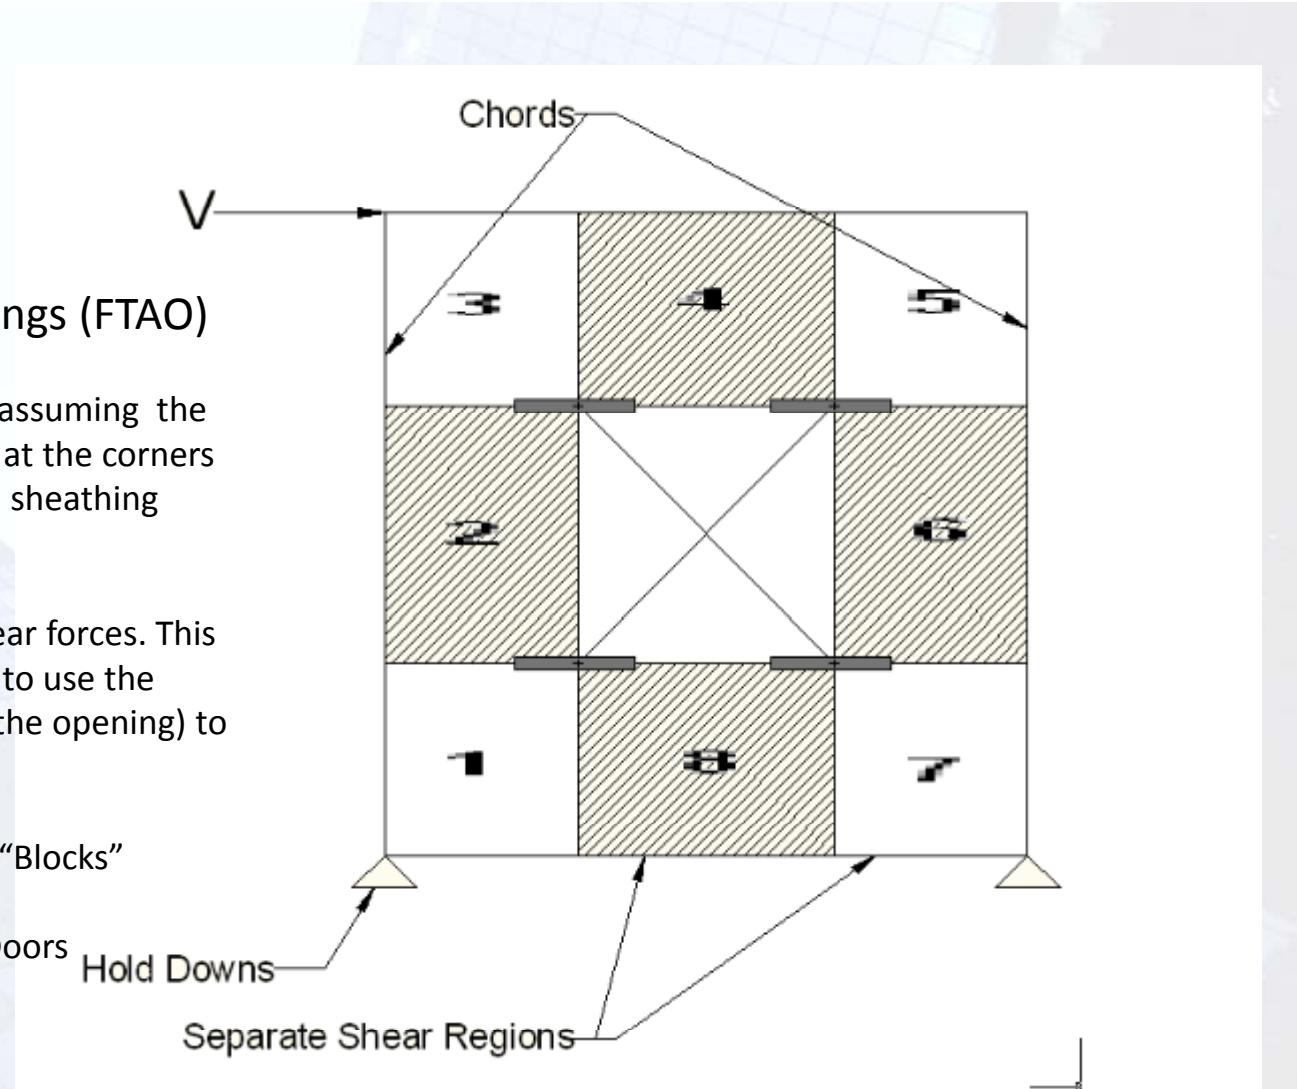

- Only Tension forces displayed

# Perforated & FTAO Design

## Force Transfer Around Openings (FTAO)

- Rational analysis of the wall assuming the straps and blocking can be added at the corners of the openings to transfer the sheathing forces across these joints.
- The sheathing resists the shear forces. This method essentially allows you to use the entire area of the wall (minus the opening) to resist the shear in the wall.
- RISA breaks up the wall into “Blocks”
- Only valid for Windows not Doors

**FTAO Wall**

FTAO wall .r3d

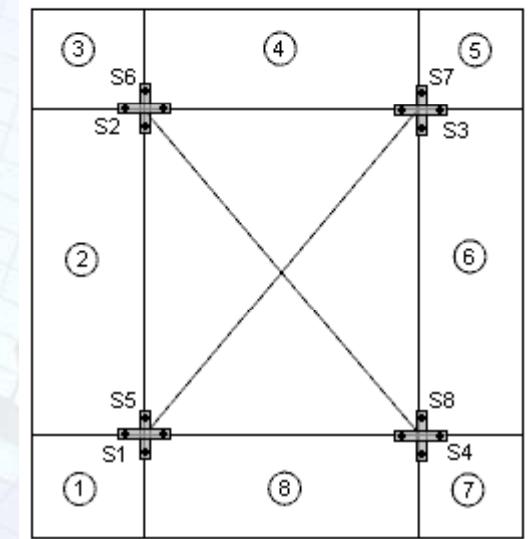

- The **average** shear force in each block of the wall is displayed at that location.
- The **maximum** shear in each of these locations will control the design of the wall.

## Header Detail Report

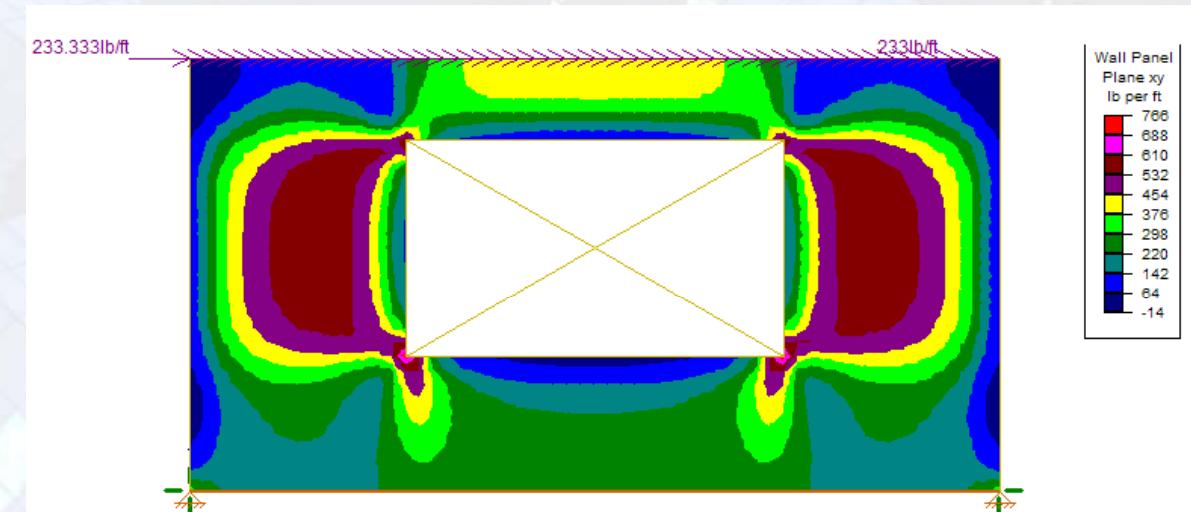

ANALYSIS SUMMARY

Block #	Unit Shear (lb/ft)	h/w Ratio
1	217.068	0.625
2	435.604	1.000
3	152.254	0.375
4	326.066	0.214
5	454.505	0.375
6	438.770	1.000
7	219.314	0.625
8	250.281	0.357

FTAO

# FTAO Wall

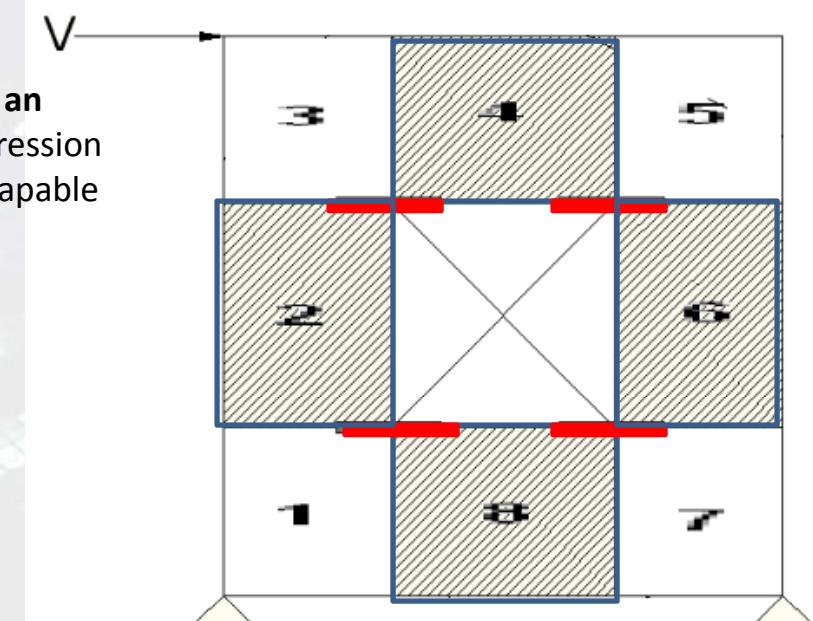

## Header Detail Report

### DESIGN DETAILS

#### OPENING STRAPS

Name	Location	Direction	Req'd Cap (lb)	Gov LC
S1	Bottom, Left	Horizontal	388.5	1
S2	Upper, Left	Horizontal	-476.5	1
S3	Upper, Right	Horizontal	485.4	1
S4	Bottom, Right	Horizontal	-393.1	1
S5	Bottom, Left	Vertical	1687.1	1
S6	Upper, Left	Vertical	-54.8	1
S7	Upper, Right	Vertical	84.0	1
S8	Bottom, Right	Vertical	-1670.7	1

- The Strap Forces are shown based on the Blocks
- The moment at the edge of each block **above or below an opening** is transmitted across the opening interface by horizontal tension straps or compression blocks
- The moment at the edge of each block that is to the **right or left of an opening** is transmitted across the opening by tension straps or compression blocks. However it is likely that the sheathing and king studs will be capable of transmitting these forces.

# Strap Forces

Straps can be used to tie walls to Columns below

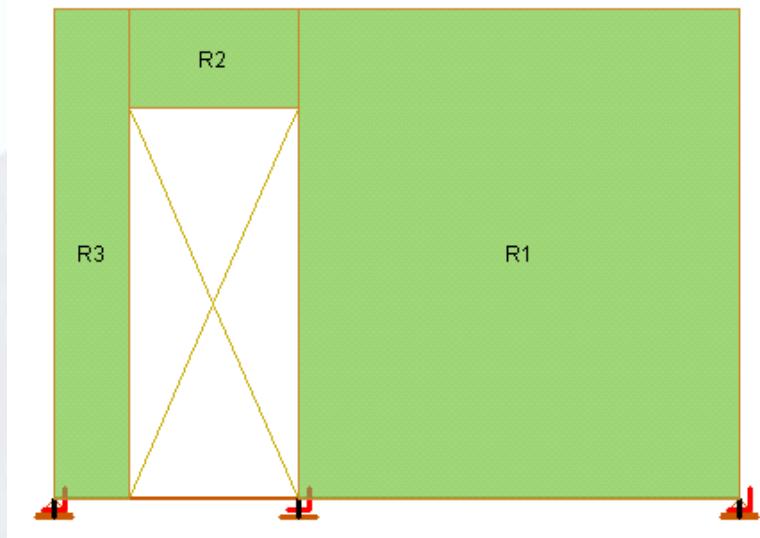

- You will need to manually add these straps in the Wall Panel Editor

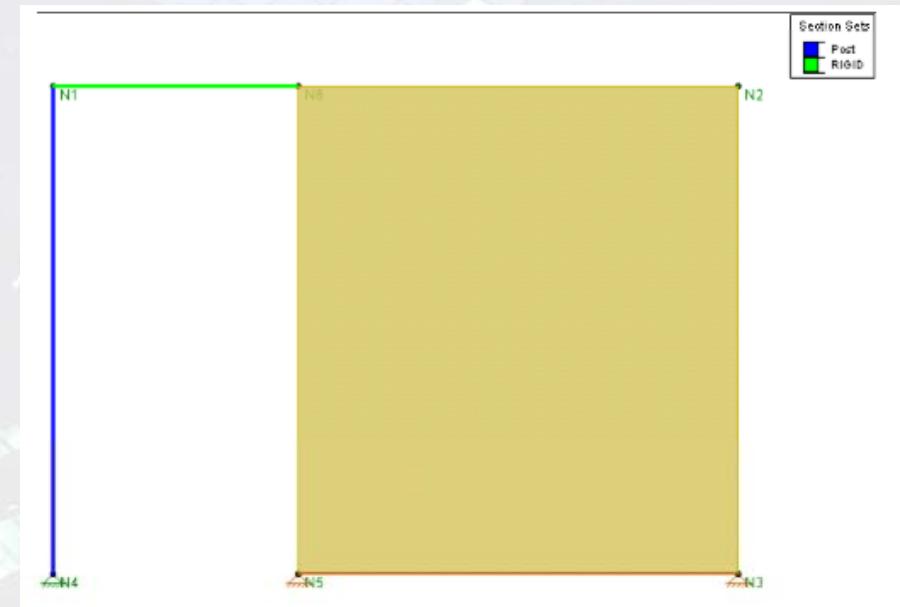

## Strap Forces

Soft Story.r3d

Problem: R3 Does not meet the Aspect Ratio. Design Not Done

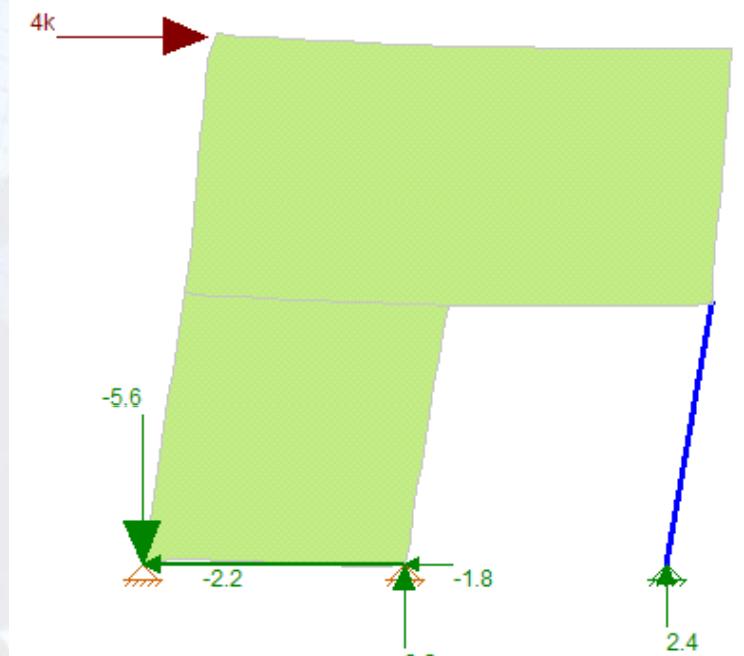

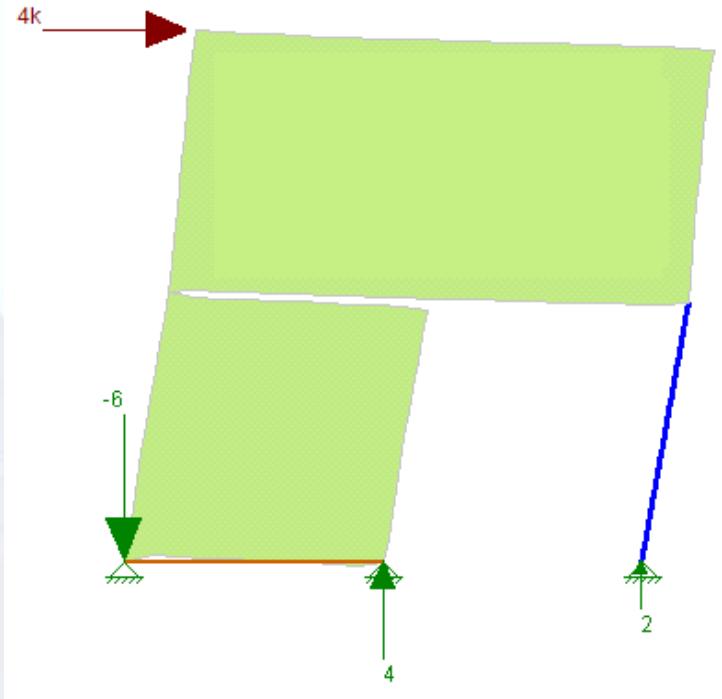

Fix: Draw Post and Beam next to the wall

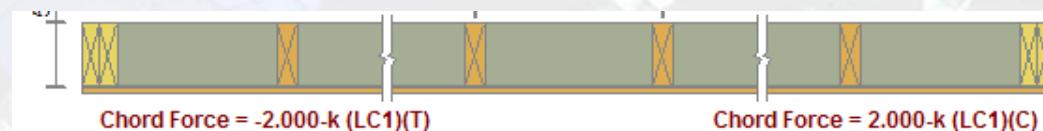

Common Problems

Problem: Soft Story Hand Calculations  FEM Model

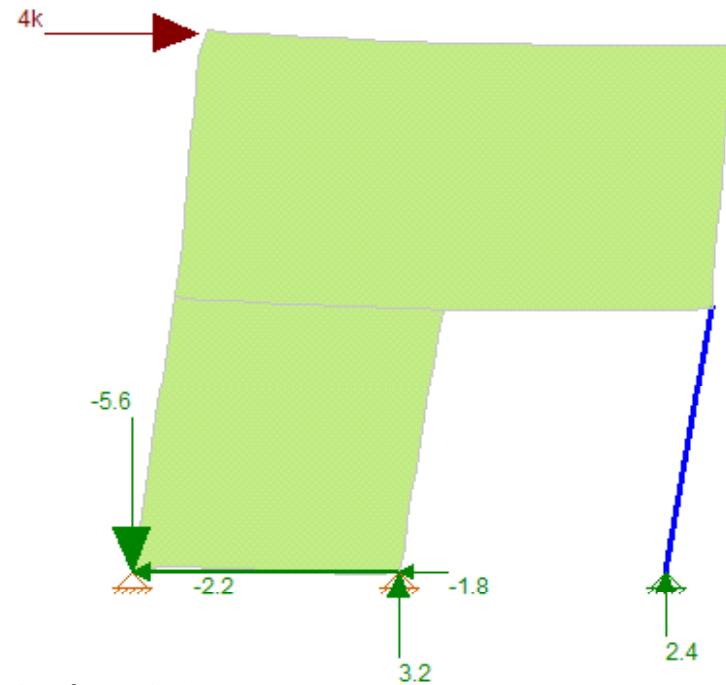

Strap Forces for both situations:  $2k$  both sides of the upper wall

Deflection is different for these two assumptions (SSAF)

## Common Problems

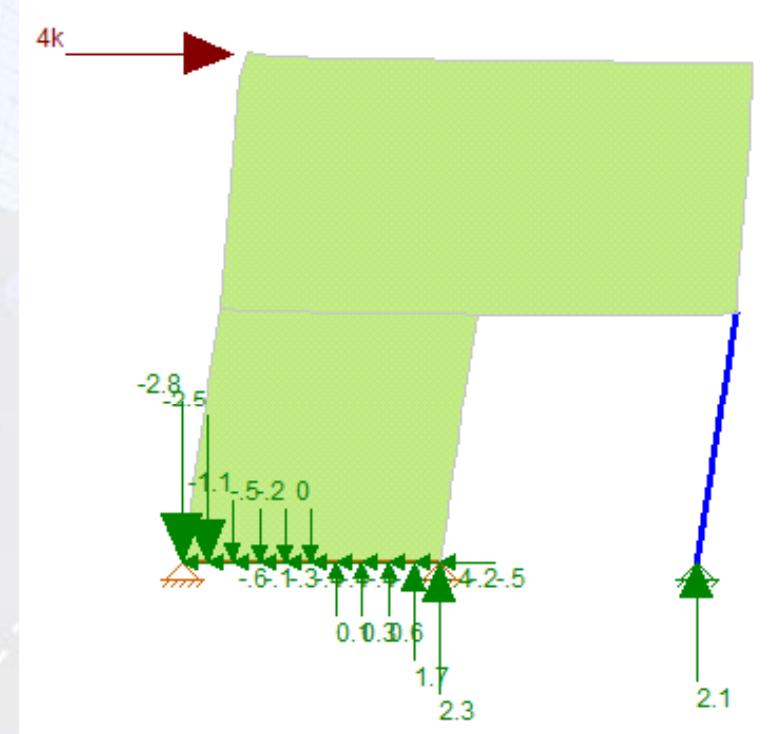

Problem: Soft Story Hand Calculations  FEM Model

What's Right?

**Engineering Judgment !!**

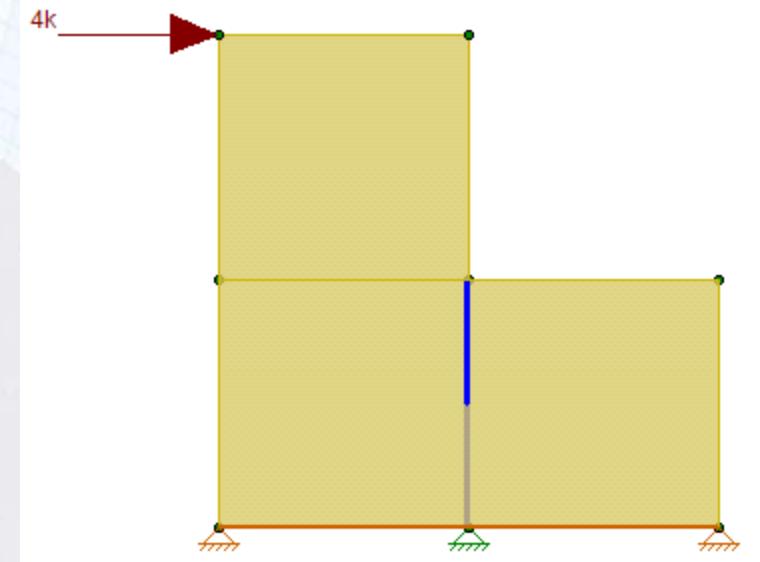

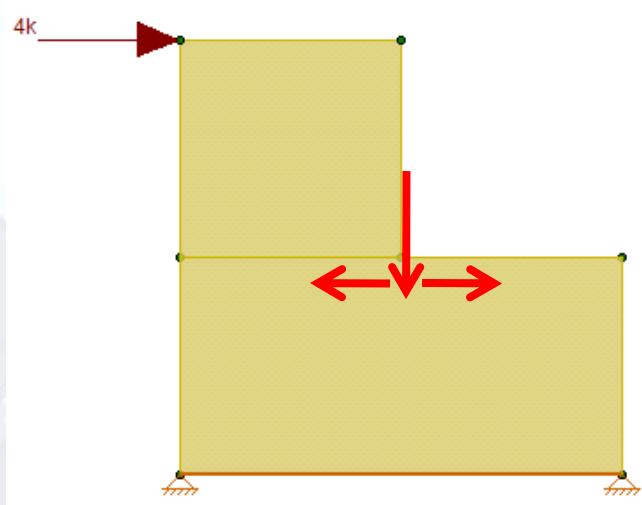

- How is it being built?  
Continuous sheathing or a strap only at the end post?

Another Option:  
Assume Fully Pinned under wall

## Common Problems

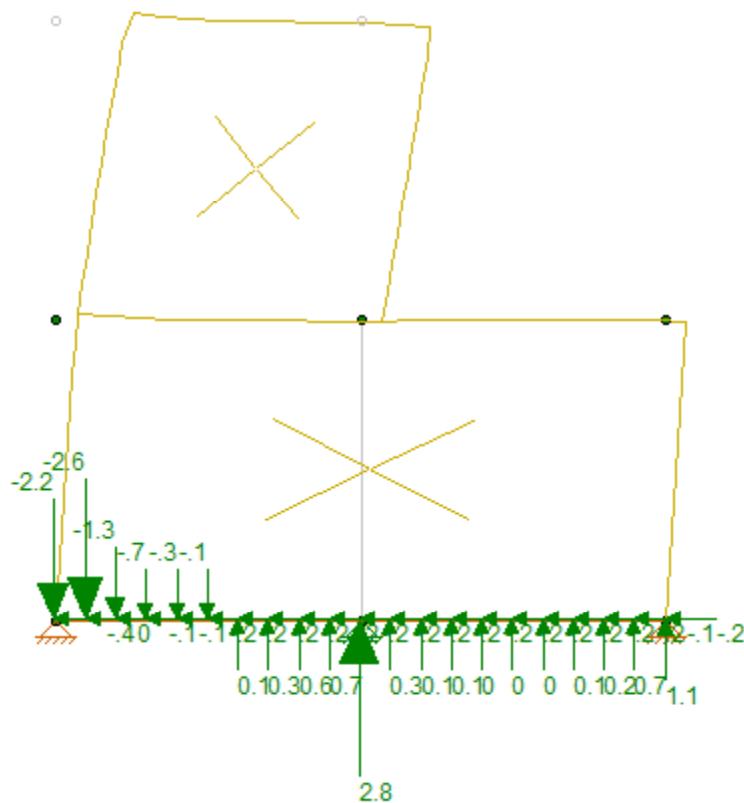

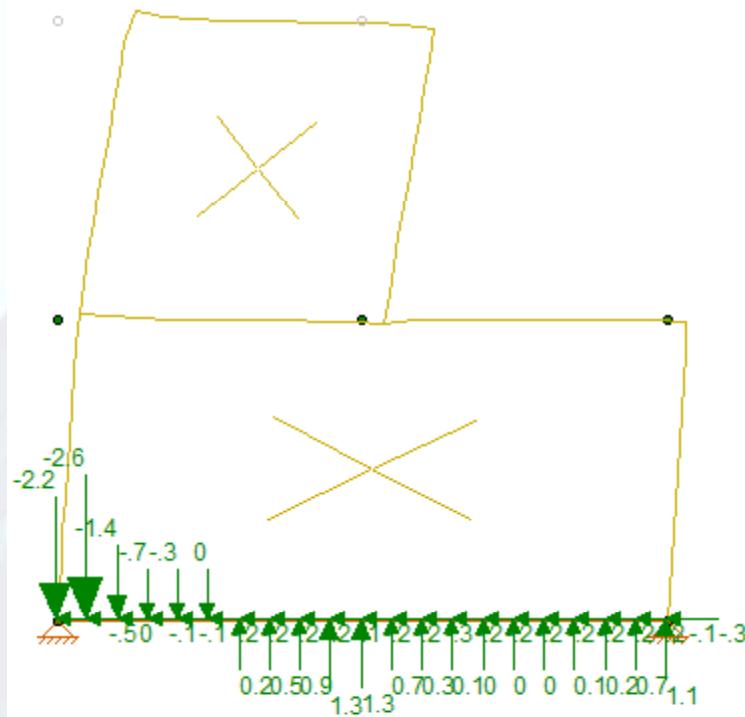

## Problem: Discontinuous Walls

- Loads are transferred into the wall below.
- Add Post to center of wall  
Post can be “Compression Only”
- Add Boundary Condition at the base of the wall

## Common Problems

## Problem: Discontinuous Walls

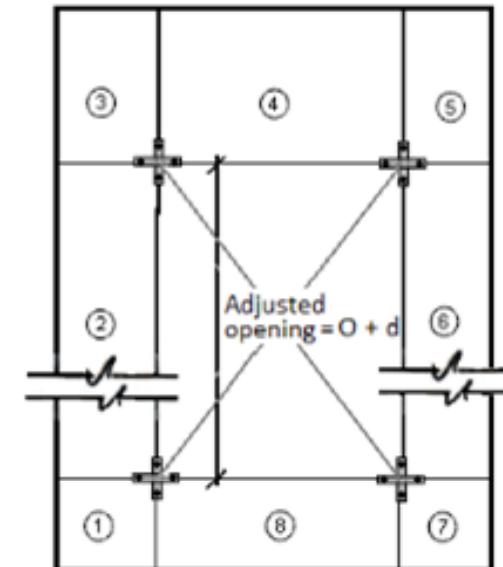

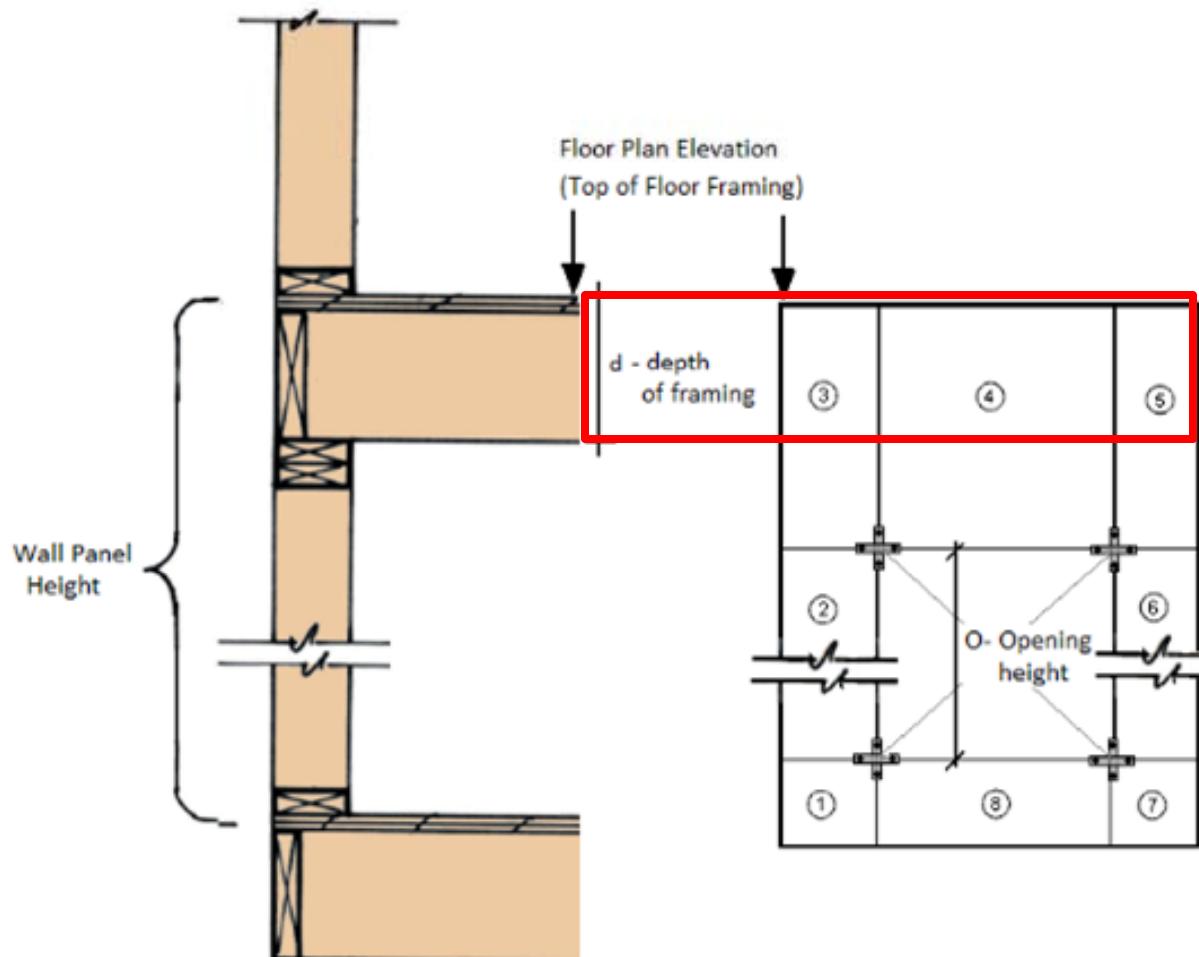

- Different Reactions due to the Post
- Different Chord Forces
- Different Deflections

## Common Problems

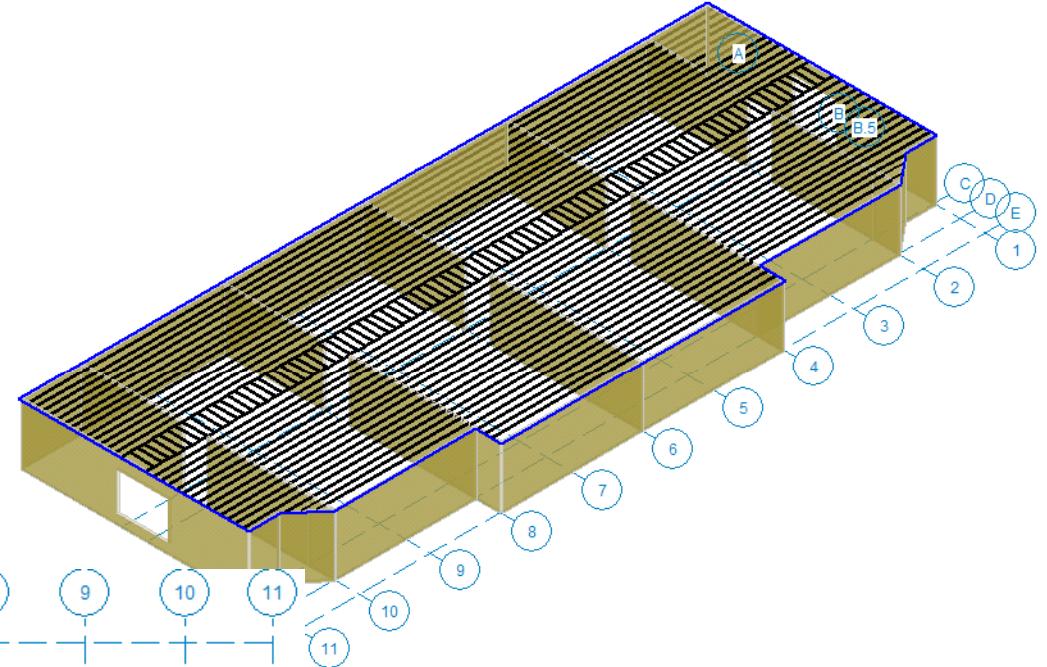

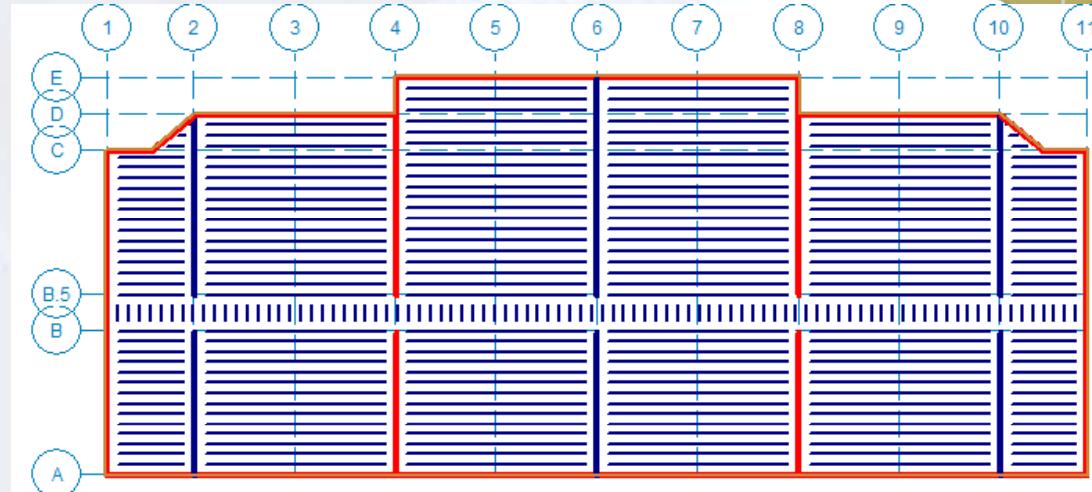

## Problem: Platform Framing (FTAO only)

Fix: Adjust your opening height to include the depth of the floor framing.

This will reduce the portion of the wall above the opening thus reducing the amount of area to transfer shear forces.

## Common Problems

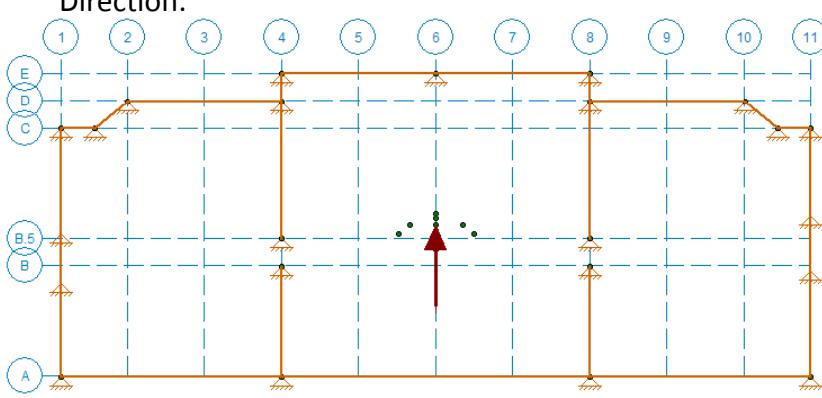

- Diaphragm defined by “Slab Edge”
- **Lateral** walls resisting Lateral loads

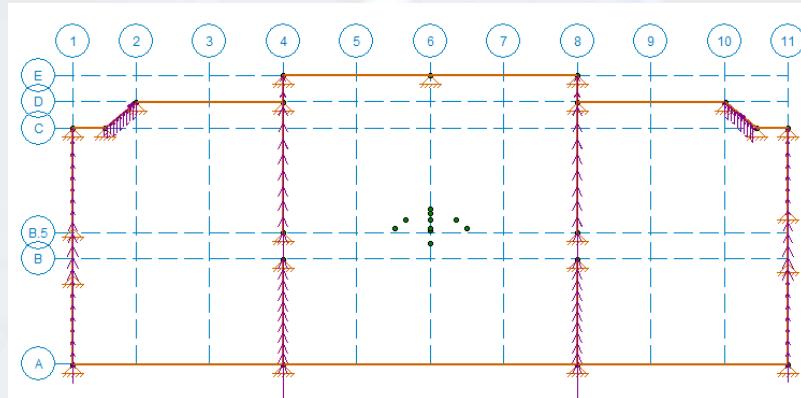

## Diaphragms Loads

Wood building Flexible .r3d

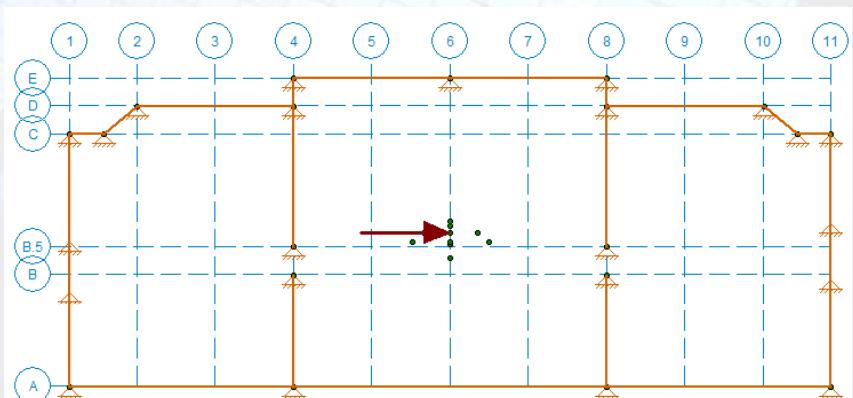

**Rigid Diaphragm:** Lateral Loads applied in X Direction:

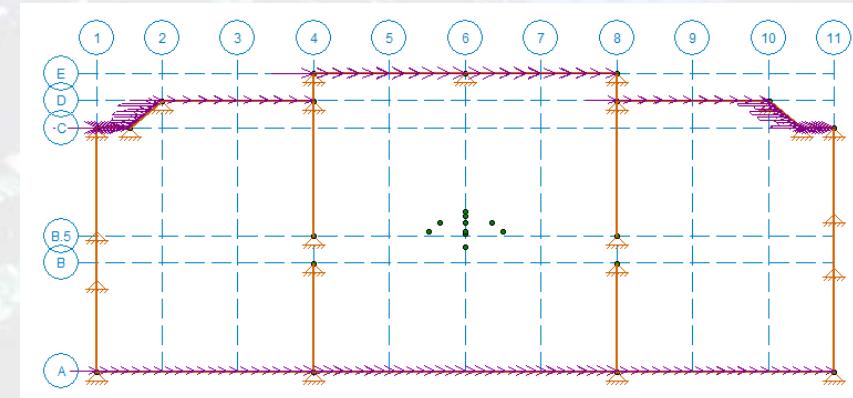

**Flexible Diaphragm:** Loads are distributed to the **Lateral** walls resisting X direction loads:

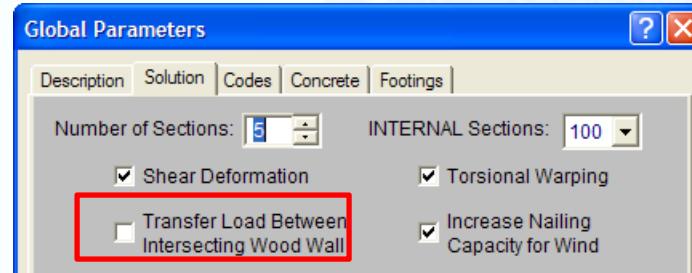

**Rigid Diaphragm:** Lateral Loads applied in Z Direction:

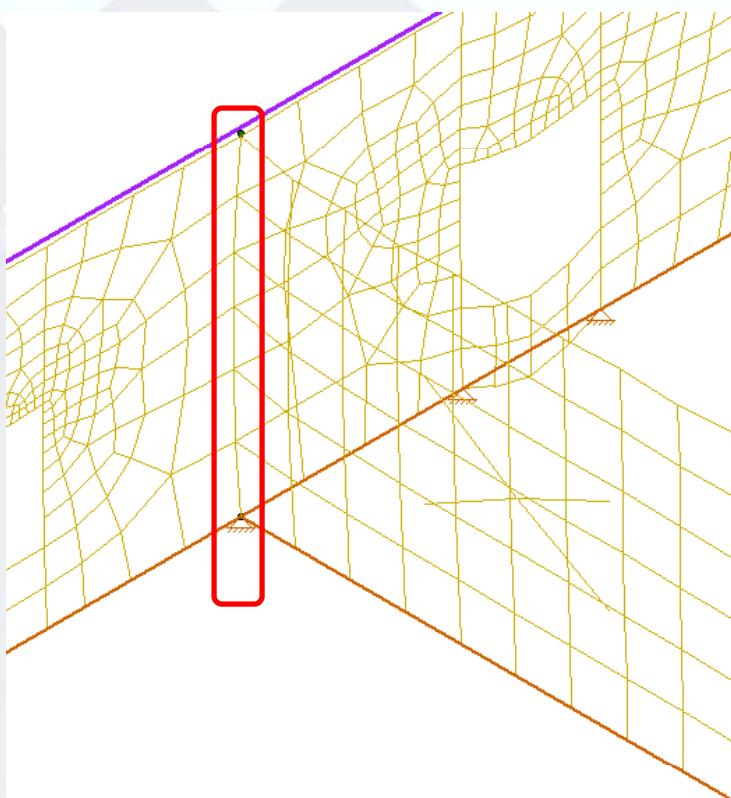

**Flexible Diaphragm:** Loads are distributed to the **Lateral** walls resisting Z direction loads:

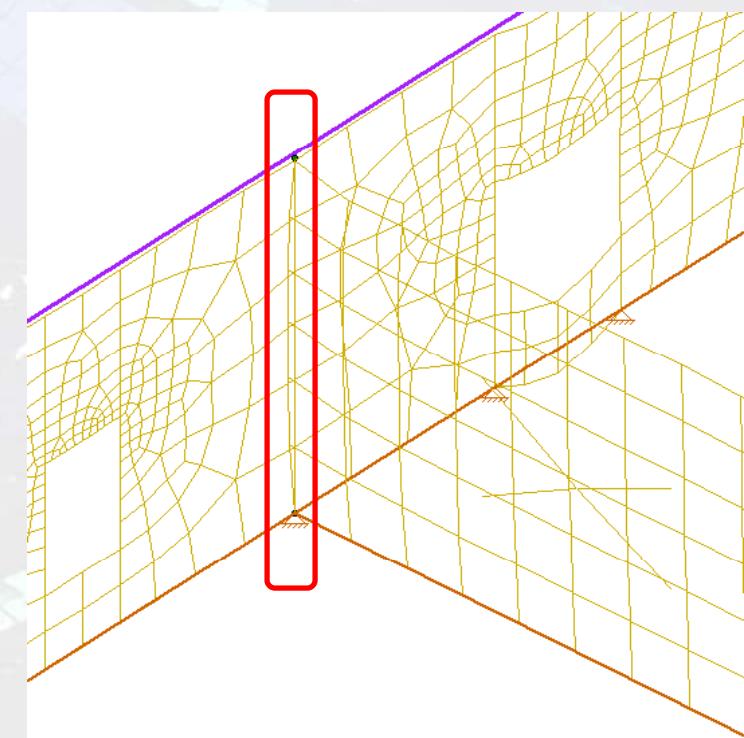

# Diaphragm Loads

# Questions?

Please let us know if you have questions. We will answer as many questions as time permits during the webinar.

Once the webinar is closed, we will post all Q&A's, at the models used and the Power Point presentation, to our website:

[www.risatech.com](http://www.risatech.com)

We will be also be sending you a PDH certificate after the presentation.

For further information, contact us at: [info@risatech.com](mailto:info@risatech.com)

Thank you for Attending!
